NON-AQUEOUS COATING COMPOSITIONS FROM POLYETHYLENE TEREPHTHALATE

R. Tomko
D. Sayre
W. Lesney
M. Rao

BACKGROUND OF THE INVENTION

This invention relates to novel coating compositions which utilize polyethylene terephthalate (PET) as a raw material for producing the film-forming resin for such coatings. Most preferably, the PET is recycled or reclaimed PET from plastic articles such as two-liter beverage bottles.

Plastics such as PET account for about 7-8 weight percent, and about 20 volume percent, of the world's solid waste. As a result, much legislation has been proposed and/or adopted requiring the recycling of plastics.

PET is the primary ingredient in plastic articles such as two-liter beverage bottles and the like. In the U.S., PET is the plastic most often recycled. The biggest uses for recycled PET are as fibers in carpeting and insulation. Recycled PET is also used in bathroom equipment and blow-molded bottles.

Processes for recycling PET beverage bottles into usable raw materials for manufacturing unsaturated polyester resins are known. For example, Eastman Chemicals Publication No. N-262A entitled Unsaturated Polyester Resins Based on Reclaimed Polyethylene Terephthalate (PET) Beverage Bottles, Calendine et al. (1984), teaches a process for converting PET beverage bottles into useful intermediates for the synthesis of unsaturated polyesters. The unsaturated polyesters are further taught as useful as raw

2007914

materials for producing unreinforced clear castings and fiber-glass reinforced laminates.

A second Eastman Chemicals Publication, No. N-292B, entitled Aromatic Polyols From Reclaimed Polyethylene Terephthalate, (1987) teaches the reclamation of PET for production of aromatic polyester polyols which are useful in making rigid polyurethane polyisocyanurate foams.

U.S. Patent 4,223,068 (Carlstrom et al.) teaches the use of the digestion product of polyalkylene terephthalate scraps with organic polyol for the production of rigid polyurethane foams.

U.S. Patent 4,417,001 (Svoboda et al.) teaches the production of low smoke isocyanurate modified polyurethane foams which are prepared from polyols which are the digestion product of digesting polyalkylene terephthalate scraps and organic polyols.

U.S. Patent 4,048,104 (Svoboda et al.) teaches the preparation of polyisocyanate prepolymers and polyurethane adhesives and foams wherein the prepolymers are prepared by reacting organic polyisocyanate with polyols which are the digestion product of polyalkylene terephthalate scraps and organic polyols.

SUMMARY OF THE INVENTION

This invention relates to novel coating compositions which utilize PET as a raw material for producing the film-forming resin for such coatings. Preferably, the present invention relates to low acid value, non-aqueous, air or bake dry coatings derived from reclaimed PET and to a process for producing such coatings. Using

2087014

reclaimed PET benefits the environment by reducing the amount of solid waste dumped at landfills. Using reclaimed PET benefits this process in that it is a relatively inexpensive raw material which, as is shown herein, produces an excellent coating composition.

5 In accordance with the present invention, PET resin (or an equivalent polyalkylene terephthalate resin), typically having a structure as shown in Figure I:

15 is first digested into lower molecular weight polymeric units through an alcoholysis reaction. The digestion product of the alcoholysis reaction is then further reacted with an acid-functional reactant, an anhydride or an isocyanate to yield a resin composition suitable for use in coating compositions. By varying the amounts and types of acid-, isocyanate or hydroxy-functional reactants according to the teachings herein, one can formulate a
20 variety of coatings systems including polyurethanes, high acid value, water-reducible coatings and low acid value, solvent-based coatings. Additionally, further chemical modifications are applicable and are further exemplified herein.

25 Accordingly, it is an object of this invention to teach the use of polyethylene terephthalate as a raw material for the production of coating compositions.

It is a further object of this invention to teach non-aqueous air and bake dry coating compositions which utilize reclaimed PET as a raw material. 2067014

These and other objects will become more readily apparent from the detailed description, examples and claims which follow below.

DETAILED DESCRIPTION OF THE INVENTION

As stated above, the present invention relates to novel non-aqueous coating compositions comprising PET as the starting material for the production of a film-forming resin.

1. PET SOURCE

The actual source of PET usable herein is not of critical importance to this invention. "Virgin" PET, that is PET which is commercially produced specifically as a raw material, is acceptable from a chemical standpoint for use herein. Likewise, recycled or reclaimed PET is acceptable from a chemical standpoint. At the time of this application, there are advantages to the environment (reduction of solid waste) and to the economics of this process (recycled PET is much less expensive than virgin PET) by using recycled or reclaimed PET; and, there are no performance disadvantages to using recycled PET versus virgin PET. As a consequence, recycled or reclaimed PET is a preferred starting material though it should be appreciated that any source of relatively pure PET is acceptable.

Typically, the sources for PET are many and varied. One source of either virgin or recycled PET is material from PET

2087914

polymer manufacturers. A second source of PET is excess PET from the operations of the beverage bottle manufacturers. A third source is private entrepreneurs dealing in reclaimed PET. A fourth source is community reclamation and recycling centers. A preferred source of PET is recycled PET beverage bottles.

For purposes of this invention, the PET should be provided in a comminuted form. It can be flaked, granulated, ground to a powder or pelletized. Preferred is flaked PET. The only constraint placed on the PET at this point is that it is relatively pure; that is, there should not be a level of impurities above about one (1) weight percent nor should there be any appreciable level of impurities which are chemically reactive within this process. PET which is acceptable for use herein should have the following characteristics:

15	Intrinsic Viscosity	0.65-0.75
	Moisture	<1.0%
	Colored PET content	<400ppm
	High Density Poly-ethylene (HDPE)	<100ppm
20	Adhesives	<500ppm
	Aluminum	<10ppm

2. CHEMISTRY OF PET

PET is comprised of repeating units of ethylene glycol and terephthalic acid connected by ester linkages. Figure I, above, shows a typical PET molecule. Each repeating unit of PET has a weight average molecular weight of 192 with one equivalent of ethylene glycol and one equivalent of terephthalic acid. By reacting PET with either an alcohol or with an acid, it is possible to reduce the average chain length of the PET molecules.

a. Alcoholysis of PET

The chemistry of PET is such that an equilibrium exists between PET, water, ethylene glycol (EG) and terephthalic acid (TPA). This equilibrium makes it possible to substantially reverse the polymerization process and depolymerize PET into its starting materials. The Eastman Chemical publications cited above refer to the process of depolymerizing PET as "glycolysis". That process comprises the catalytic reaction of PET with a polyol. As further defined and exemplified below, it should be appreciated that hydroxy-functional materials having OH functionality greater or less than two can be effectively utilized in the present process; thus, the present process is herein referred to as "alcoholysis". In the context of the present invention, reference to "alcohol" should be understood to refer to both mono- and poly-functional alcohols unless specifically taught otherwise.

The number of OH equivalents from the alcohol should be equal to, or in excess of, the number of equivalents of ethylene glycol from the PET. Preferably, the ratio of equivalents should be between about 1:1 to about 3:1, more preferably about 1:1 to about 1.5:1 moles of OH equivalents per mole of PET.

Suitable catalysts for alcoholysis of PET include the traditional transesterification catalysts including stannous octoate, calcium hydroxide, calcium formate, lithium hydroxide, barium hydroxide, sodium hydroxide, sodium methoxide, manganese acetate tetrahydrate, and polymeric diorganotin catalysts such as dibutyl tin oxide (trade name Facoat, available from M&T Chemicals).

2087914

Most preferred is dibutyl tin oxide. If used, the catalyst should be present in an amount of from about 0.2 weight % to about 1.5 weight % based upon the total weight of the PET and alcohol.

When PET and a alcohol are reacted together in the presence of the above catalyst and heat, the high molecular weight PET molecule is broken down into shorter chain fragments. This is accomplished through chain attack and exchange by the alcohol with the ethylene glycol units of the PET molecule. This attack and exchange continues to occur until a new equilibrium is established between the PET, the shorter chain length PET, the shorter chain length PET substituted with the alcohol, the alcohol and ethylene glycol. Figure II shows the typical products of alcoholysis of PET with a representative polyol:

Figure II:

As can be seen from Figure II, subsequent to alcoholysis all remaining PET fragments and products in equilibrium therewith are hydroxyl terminated. As described further below, they can be reacted with acids, anhydrides, fatty acids, isocyanates and the like to form excellent coating compositions.

a.1. Alcohols for use in Alcoholysis of PET

Typically, the alcohols will have number average molecular weights of below about 4000 and typical number average molecular weights will range from about 30 to about 4000, and especially 100

2387914

to about 400. Methods of preparing alcohols are well known in the art and the method of preparation of the alcohols is not critical to the practice of this invention.

Suitable alcohols include the C1-C22 linear and branched saturated and unsaturated alcohols including, for example, methanol, ethanol, propanol, butanol, hexanol, linoleyl alcohol, trimethylolpropane diallyl ether, allyl alcohol, 2-mercapto ethanol and the like. Additionally, useful alcohols include the hydroxy-functional polyethers, polyesters, polyurethanes, polycaprolactones, etc. as generally discussed in Sections a.1.a. through a.1.e. below.

a.1.a. Saturated and unsaturated polyols include glycerol, castor oil, ethylene glycol, dipropylene glycol, 2,2,4-trimethyl 1,3-pentanediol, neopentyl glycol, 1,2-propanediol, 1,3-propanediol, 1,4-butanediol, 1,3-butanediol, 2,3-butanediol, 1,5-pentanediol, 1,6-hexanediol, 2,2-dimethyl-1,3-propanediol, Bisphenol A tetraethoxylate, dodecahydro Bisphenol A, 2,2'-thio diethanol, dimethylol propionic acid, acetylenic diols, hydroxy-terminated polybutadiene, 1,4-cyclohexanedimethanol, 1,2-cyclohexanedimethanol, 1,3-cyclohexanedimethanol, 1,4-bis(2-hydroxyethoxy)cyclohexane, trimethylene glycol, tetramethylene glycol, pentamethylene glycol, hexamethylene glycol, dodecamethylene glycol, dioethylene glycol, triethylene glycol, tetraethylene glycol, norbornylene glycol, 1,4-benzenedimethanol, 1,4-benzenediethanol, 2,4-dimethyl-2-ethylenehexane-1,3-diol, 2-butene-1,4-diol, and polyols such as trimethylolathane,

2087914
trimethylolpropane, trimethylolpropane monoallyl ether,
trimethylolhexane, triethylolpropane, 1,2,4-butanetriol, glycerol,
pentaerythritol, dipentaerythritol, etc.

5 a.1.b. Polyether polyols are well known in the art and
are conveniently prepared by the reaction of a diol or polyol with
the corresponding alkylene oxide. These materials are commercially
available and may be prepared by a known process such as, for
example, the processes described in Encyclopedia of Chemical
10 Technology, Volume 7, pages 257-262, published by Interscience
Publishers, Inc., 1951. Representative examples include the
polypropylene ether glycols and polyethylene ether glycols such as
those marketed as NIAK Polyols from Union Carbide Corporation.

15 a.1.c. Another useful class of hydroxy-functional
polymers are those prepared by condensation polymerization reaction
techniques as are well known in the art. Representative
condensation polymerization reactions include polyesters prepared
by the condensation of polyhydric alcohols and polycarboxylic acids
or anhydrides, with or without the inclusion of drying oil,
semi-drying oil, or non-drying oil fatty acids. By adjusting the
20 stoichiometry of the alcohols and the acids while maintaining an
excess of hydroxyl groups, hydroxy-functional polyesters can be
readily produced to provide a wide range of desired molecular
weights and performance characteristics.

25 The polyester polyols are derived from one or more aromatic
and/or aliphatic polycarboxylic acids, the anhydrides thereof, and
one or more aliphatic and/or aromatic polyols. The carboxylic

acids include the saturated and unsaturated polycarboxylic acids and the derivatives thereof, such as maleic acid, fumaric acid, succinic acid, adipic acid, azelaic acid, and dicyclopentadiene dicarboxylic acid. The carboxylic acids also include the aromatic polycarboxylic acids, such as phthalic acid, isophthalic acid, terephthalic acid, etc. Anhydrides such as maleic anhydride, phthalic anhydride, trimellitic anhydride, or Nadic Methyl Anhydride (brand name for methyl bicyclo [2.2.1] heptene-2,3-dicarboxylic anhydride isomers) can also be used.

Representative saturated and unsaturated polyols which can be reacted in stoichiometric excess with the carboxylic acids to produce hydroxy-functional polyesters include the diols taught in a.1.a. and a.1.b., above.

Typically, the reaction between the polyols and the polycarboxylic acids is conducted at about 120°C to about 200°C in the presence of an esterification catalyst such as dibutyl tin oxide.

a.1.d. Additionally, hydroxy-functional polymers can be prepared by the ring opening reaction of epoxides and/or polyepoxides with primary or, preferably, secondary amines or polyamines to produce hydroxy-functional polymers. Representative amines and polyamines include ethanol amine, N-methylethanol amine, dimethyl amine, ethylene diamine, isophorone diamine, etc. Representative polyepoxides include those prepared by condensing a polyhydric alcohol or polyhydric phenol with an epihalohydrin, such as epichlorohydrin, usually under alkaline conditions. Some

of these condensation products are available commercially under the designations EPON from Shell Chemical Company, and methods of preparation are representatively taught in U.S. patents 2,592,560; 2,582,985 and 2,694,694.

5 a.1.a. Other useful hydroxy-functional polymers can be prepared by the reaction of an excess of at least one alcohol, such as those representatively described above, with isocyanates to produce hydroxy-functional urethanes. Representative mono-functional isocyanates include allyl isocyanate and tolyl isocyanate. Representative polyisocyanates include the aliphatic compounds such as ethylene, trimethylene, tetramethylene, 10 pentamethylene, hexamethylene, 1,2-propylene, 1,2-butylene, 2,3-butylene, 1,3-butylene, ethylidene and butylidene diisocyanates; the cycloalkylene compounds such as 3-isocyanato methyl-3,5,5-trimethyl cyclohexylisocyanate, and the 15 1,3-cyclopentane, 1,3-cyclohexane, and 1,2-cyclohexane diisocyanates; the aromatic compounds such as m-phenylene, p-phenylene, 4,4'-diphenyl, 1,5-naphthalene and 1,4-naphthalene diisocyanates; the aliphatic-aromatic compounds such as 20 4,4'-diphenylene methane, 2,4- or 2,6-toluene, 4,4'-toluidine, and 1,4-xylylene diisocyanates; benzene 1,3-bis (1-isocyanato-1-methyl ethyl); the nuclear substituted aromatic compounds such as dianisidine diisocyanate, 4,4'-diphenylether diisocyanate and chlorodiphenylene diisocyanate; the triisocyanates such as 25 triphenyl methane-4,4',4''-triisocyanate, 1,3,5-triisocyanate benzene and 2,4,6-triisocyanate toluene; and the tetraisocyanates

2087914

such as 4,4'-diphenyl-dimethyl methane-2,2'-5,5'-tetraisocyanate; the polymerized polyisocyanates such as tolylene diisocyanate dimers and trimers, and other various polyisocyanates containing biuret, urethane, and/or allophanate linkages. The isocyanates and the alcohols are typically reacted at temperatures of 25°C to about 150°C to form the hydroxy-functional polymers.

Especially preferred hydroxy-functional materials in the practice of this invention are mono-functional alcohols such as trimethylolpropane diallyl ether and allyl alcohol; and diols and triols such as ethylene glycol, dipropylene glycol, 2,2,4-trimethyl 1,3-pentanediol, neopentyl glycol, 1,2-propanediol, 1,3-propanediol, 1,4-butanediol, 1,3-butanediol, 2,3-butanediol, 1,5-pentanediol, 1,6-hexanediol, 2,2-dimethyl-1,3-propanediol, 1,4-cyclohexanedimethanol, 1,2-cyclohexanedimethanol, 1,3-cyclohexanedimethanol, 1,4-bis(2-hydroxyethoxy)cyclohexane, trimethylene glycol, tetra methylene glycol, pentamethylene glycol, hexamethylene glycol, decamethylene glycol, diethylene glycol, triethylene glycol, tetraethylene glycol, norbornylene glycol, 1,4-benzenedimethanol, 1,4-benzenediethanol, 2,4-dimethyl-2-oxylonohexane-1,3-diol, 2-butene-1,4-diol, and polyols such as trimethylolpropane, trimethylolpropane monoallyl ether, trimethylolhexane, triethylolpropane, 1,2,4-butanetriol, glycerol, pentaerythritol, dipentaerythritol; and mixtures thereof.

Most preferred are trimethylolpropane diallyl ether, propylene glycol, ethylene glycol, diethylene glycol, and mixtures thereof.

2087014

It should be appreciated that other alcohols should be considered equivalents of those named herein.

b. Further Reactions of the Alcoholysis Products

As discussed briefly above, the product of the alcoholysis reaction is further reacted to produce a polyester product useful in a coating composition. Since the alcoholysis reaction products are hydroxy-functional, they can be further reacted with anhydrides, acids, fatty acids and isocyanates including those taught below to produce exceptional coating compositions. By controlling the levels and amounts of reactants, as discussed below, one can formulate either high acid value or low acid value systems from the alcoholysis reaction products. The products of such reactions include alkyds and polyesters which can be air or bake dried or which can be further mixed, reacted or modified to create dispersions of emulsion polymers using the alkyds or polyesters as dispersing media and acrylic modified alkyds and polyesters.

Suitable acid-functional materials include mono-functional acids such as benzoic, crotonic and sorbic acids; and acids having an acid functionality on average of at least two, such as phthalic acid, succinic acid, adipic acid, azelaic acid, maleic acid, fumaric acid, trimellitic acid, trimesic acid, naphthalene dicarboxylic acids, carboxy-terminated polybutadiene, benzophenone tetracarboxylic dianhydride, 4,4'-dicarboxy diphenoxy ethane, and the hydroxy carboxylic acids of piralactone. Other suitable acids include the saturated acids such as butyric, caproic, caprylic,

2087914

capric, lauric, myristic, palmitic, stearic, 12-hydroxystearic, arachidic, behenic and lignoceric acids; the unsaturated acids such as palmitoleic, oleic, ricinoleic, linoleic, linolenic, eleostearic, llicaric, gadoleic and eracic acids; and the oils (and their fatty acids) such as canola, rapeseed, castor, dehydrated castor, coconut, coffee, corn, cottonseed, fish, lard, linseed, oticica, palm kernal, peanut, perilla, safflower, soya, sunflower, tallow, tung, walnut, vernonia, tall and menhaden oils; and blends and mixtures of natural and synthetic oils and fatty acids, particularly those oils and fatty acids with high iodine numbers.

Representative anhydrides include, phthalic anhydride, 3-nitrophthalic anhydride, 4-nitrophthalic anhydride, 3-flourophthalic anhydride, 4-chlorophthalic anhydride, tetrachlorophthalic anhydride, tetra bromophthalic anhydride, tetrahydrophthalic anhydride, hexahydro phthalic anhydride, methylhexahydrophthalic anhydride, succinic anhydride, dodecenylsuccinic anhydride, octylsuccinic anhydride, maleic anhydride, dichloromaleic anhydride, glutaric anhydride, adipic anhydride, chlorendic anhydride, itaconic anhydride, citraconic anhydride, endo-methylenetetrahydrophthalic anhydride, cyclohexane-1,2-dicarboxylic anhydride, 4-cyclohexene-1,2-dicarboxylic anhydride, 4-methyl-4-cyclohexene-1,2-dicarboxylic anhydride, 5-norbornene-2,3-dicarboxylic anhydride, 1,4-cyclohexadiene-1,2-dicarboxylic anhydride,

2087914

1,3-cyclopentanedicarboxylic anhydride, diglycolic acid anhydride, and the like.

Other useful anhydrides include those anhydrides having a free carboxyl group in addition to the anhydride group such as trimellitic anhydride, aconitic anhydride, 2,6,7-naphthalene tricarboxylic anhydride, 1,2,4-butane tricarboxylic anhydride, 1,3,4-cyclopentane tricarboxylic anhydride, and the like.

It should be appreciated that other acids and anhydrides should be considered equivalents of those named herein.

The acid- or anhydride functional material will generally have a number average molecular weight below about 2000. Preferably the acid- or anhydride-functional material will have a number average molecular weight of below about 400. Typical number average molecular weights of these materials will range from about 96 to about 400.

Especially preferred acids and anhydrides include the vegetable fatty acids described above and trimellitic anhydride.

c. High and Low Acid Value Products using the Alcoholysis Reaction Products

As stated above, the alcoholysis reaction products are further reacted with acid or anhydride functional materials to produce either high or low acid value products. For purposes of the present invention, the term "high acid value" is meant to be those compositions having acid values greater than about 30. The term "low acid value" is meant to be those compositions having acid values lower than about 20. Compositions having acid values

2087914

between about 20 and about 30 tend to exhibit characteristics of both high and low acid value products and, thus, are not categorized as either high acid value or low acid value, although it should be appreciated that with some trial and error such compositions may be acceptable in either category.

As a guideline, in order to formulate an alcoholysis reaction product to a high acid value of between about 55 and about 65, the following stoichiometric proportions (in moles of equivalents) of materials should be used. For each mole of PET used, from about 1.1 to about 1.5 moles of OH should be used in the alcoholysis reaction, followed by further reaction with about 1.0 to about 1.2 moles of acid or anhydride. Preferably, the moles of OH to PET should be about 1.15:1 to about 1.35:1 and the moles of acid/anhydride to PET should be about 1.0:1 to about 1.10:1 for such higher acid value products.

In order to formulate an alcoholysis reaction product to a low acid value of less than about 20, the following stoichiometric proportions (in moles of equivalents) of materials should be used. For each mole of PET used, from about 1.0 to about 1.35 moles of OH should be used in the alcoholysis reaction, followed by further reaction with about 0.50 to about 0.75 moles of acid or anhydride. Preferably, the moles of OH to PET should be about 1:1 to about 1.25:1 and the moles of acid/anhydride to PET should be about 0.50:1 to about 0.65:1.

d. Final Coating Products

2087914

The products of Section 2.c. can be used by themselves, in combination with other well known coatings additives, including pigments, flow agents, catalysts, diluents, solvents, ultraviolet light absorbers, and the like, or can be further mixed, reacted or modified as described below.

The high acid value products (that is, acid values greater than about 30) of Section 2.c., or such products in combination with the above-described additives, can be dispersed or reduced in water once neutralized with a weak base solution such as a tertiary amine in water. Neutralization techniques are well known in the coatings art. In a preferred embodiment, the high acid value products of Section 2.c. can be reduced in water and thereafter serve as the stabilizing media for the emulsion polymerization of acrylic and other ethylenically unsaturated monomers, including acrylic addition monomers, oligomers and polymers; particularly one or more alkyl esters of acrylic acid or methacrylic acid; optionally together with one or more other ethylenically unsaturated monomers.

Suitable acrylic esters include methyl (meth)acrylate, ethyl (meth)acrylate, propyl (meth)acrylate, butyl (meth)acrylate, hydroxy ethyl (meth)acrylate, 2-ethyl hexyl (meth)acrylate, acrylonitrile, acrylamide, vinyl polymers such as polymers of vinyl esters of inorganic or organic acids, including vinyl chloride, vinyl acetate, vinyl propionate, vinyl toluene, etc., styrene, and mixtures thereof.

2087914

Emulsion polymerization reaction conditions are well known in the art and can include the procedures taught in U.S. Patent 4,116,903, incorporated herein by reference as well as the procedures taught in the Examples below.

5 The low acid value products (that is, acid values less than about 20) of such section, or such products in combination with the above-described additives, can be reduced in solvents such as xylene, toluene, benzene, mineral spirits and the like. Such products can then be allowed to air dry or forced to dry by baking
10 as is well known in the art. A melamine, or equivalent, agent would preferably be added to facilitate drying in the bake dry systems. In a preferred embodiment, the low acid value products of Section 2.c. can be directly modified with acrylic monomers, oligomers and polymers to produce air dry, bake and water-reducible
15 coatings.

Suitable acrylic monomers, oligomers and polymers include those acrylic, vinylic and ethylenically unsaturated materials taught to be useful with the high acid value products as well as the acrylic acids themselves such as acrylic acid, methacrylic acid
20 and itaconic acid.

In another preferred embodiment, either the high or the low acid value products of Section 2.c. can be further modified by direct acrylic modification. Direct acrylic modification is typically conducted under conditions also well known in the art,
25 including the procedures taught in U.S. Patents 4,735,995 and

2087014

4,873,281, incorporated herein by reference, as well as by the procedures taught in the Examples below.

When acrylic modifying the low acid value products, the incorporation of a high level of acid-functional acrylic materials will enable the final, acrylic-modified coating product to be reducible in water or other aqueous systems. Generally, amounts of acid-functional acrylic materials greater than about 1.0% by weight of the total amount of acrylic and other ethylenically unsaturated materials will result in a coating composition which is water reducible. Amounts less than the above will generally result in coatings which are not water reducible.

The coatings of this invention can also be blended with other acrylic resins, alkyds, polyesters and coating resin systems.

The coatings of this invention may typically be applied to any substrate such as metal, plastic, wood, and glass, by brushing, dipping, roll coating, flow coating, spraying or other method conventionally employed in the coating industry.

Representative opacifying pigments include white pigments such as titanium dioxide, zinc oxide, antimony oxide, etc. and organic or inorganic chromatic pigments such as iron oxide, carbon black, phthalocyanine blue, etc. The coatings may also contain extender pigments such as calcium carbonate, clay, silica, talc, etc.

The following examples have been selected to illustrate specific embodiments and practices of advantage to a more complete understanding of the invention. Unless otherwise stated, "parts" means parts-by-weight and "percent" is percent-by-weight.

2087914

EXAMPLE I: ALCOHOLYSIS OF PET

A high acid value, water reducible resin was prepared according to the following procedure:

A 3l, 4-necked round bottom flask equipped with inert gas, mechanical stirrer, Barrett tube and Friedrich's condenser was charged with 342.8g of polyethylene terephthalate, 755.3g of trimethylolpropane diallyl ether, 5.3g of dibutyl tin oxide catalyst and 37g xylene. The contents were heated to 460F and held until all contents had melted and a clear solution was obtained. The solution was cooled to 325F and 290.4g of trimellitic anhydride, 344.4g dehydrated castor oil fatty acid and 65.8g linseed oil fatty acid were added. The contents were heated to 470F and held for an acid value of between 60-65 and a viscosity less than 10,000cps at 90% in propylene glycol monopropyl ether. Once reached, heat was removed and the contents allowed to cool. The final resin product had an NVM of 89.85, a viscosity of 5300cps (using Brookfield LVT#3, 12rpm), acid value of 62, Mz of 4289, Mw of 1941, Mn of 1036 and Pd of 1.87.

The resin was further reduced in water by combining the resin, water and triethylamine in the following amounts:

65g of resin

65g of water

6.1g of triethylamine.

EXAMPLE II: ALCOHOLYSIS OF PET

A high acid value, water reducible resin was prepared according to the following procedure:

2087914

5 A 31, 4-necked round bottom flask equipped with inert gas, mechanical stirrer, Barrett tube and Friedrich's condenser was charged with 542.6g of polyethylene terephthalate, 735.3g of trimethylolpropane diallyl ether, 5.3g of dibutyl tin oxide catalyst and 55g xylene. The contents were heated to 460F and held until all contents had melted and a clear solution was obtained. The solution was cooled to 325F and 290.0g of trimellitic anhydride and 409.5g of high content linoleic fatty acid (Prifac 8960) were added. The contents were heated to 470F and held for an acid value of between 80-85. Once reached, heat was removed and the contents allowed to cool. The final resin product had an NVM of 95.25, a viscosity of 18,600cps (using Brookfield LVT#3, 12rpm), acid value of 82, Mz of 3649, Mw of 1643, Mn of 919 and Pd of 1.79.

EXAMPLE III: ALCOHOLYSIS OF PET

15 A low acid value resin was prepared according to the following procedure:

20 A 31, 4-necked round bottom flask equipped with inert gas, mechanical stirrer, Barrett tube and Friedrich's condenser was charged with 1015.7g of polyethylene terephthalate, 414.6g of propylene glycol, 90g of trimethylolpropane diallyl ether, 5.5g of dibutyl tin oxide catalyst and 40g xylene. The contents were heated to 460F and held until all contents had melted and a clear solution was obtained. The solution was cooled to 325F and 59.0g of trimellitic anhydride was added. The contents were heated to 25 470F and held for an acid value of less than 10. Once reached, heat was removed and the contents allowed to cool. The final resin

2087914

product had an NVM of 89.5, a viscosity greater than 20,000cps (using Brookfield LVT#3, 12rpm), acid value of 4.1, Mz of 2180, Mw of 1346, Mn of 847 and Pd of 1.59.

EXAMPLE IV: DIRECT ACRYLIC MODIFICATION

5 400g of the resin of Example III and 150g of Propasol
(propylene glycol monobutyl ether) were charged to a reaction
vessel and heated to about 140C. Added to the vessel over a 3.5
hour period was 286g of methyl methacrylate, 43g of methacrylic
acid, 29g of styrene, 50g of ethyl hexyl acrylate. A second feed
10 of 9g of t-butyl perbenzoate and 100g of Propasol was added over
the same time period. Upon complete addition of both feeds, a
chase of 1.9g t-butyl perbenzoate in 20g of Propasol was added over
a 1.5 hour time period. Heat was removed and the contents of the
vessel filtered.

15 EXAMPLE V: AIR DRY COATING FORMULA

A resin prepared according to the procedure of Example I can
be formulated to a high solids, solvent-based air dry coating
having NVM of 80.55, VOC less than 250 g/l as follows:

In a high speed disperser, grind:

20	422.6g	Resin of Example I
	47.5	Aromatic Naphtha
	7.7	Soya Lecithin
	202.3	Rutile titanium dioxide
	Run on high for 15 minutes	
25	Add 203.9	Resin of Example I
	19.3	Aromatic Naphtha
	1.2	12% Cobalt Catalyst
	29.5	10% Calcium Drier
	2.1	Methyl ethyl ketoxime
30	81.9	Aromatic Naphtha
	0.5	Defoamer (Byk 052)

EXAMPLE VI: BAKE DRY ENAMEL FORMULA

2087914

A resin prepared according to the procedure of Example III can be formulated to a bake dry coating having PVC 18.5, NVM 80.9, weight per gallon 11.8 lbs/gal and VOC of 2.25 lbs/gal as follows:

In a high speed disperser, grind the following.

5	173.1g	Resin of Example III
	24.0	Propasol P
	423.1	Rutile titanium dioxide
	Run to 7H (Hegman Grind)	
	100.0	Propasol P
10	241.5	Resin of Example III
	132.7	Melamine
	80.2	Propasol P

WHAT IS CLAIMED IS:

1. A non-aqueous coating composition comprising the reaction product of:

- a. polyethylene terephthalate with an alcohol in the presence of a catalyst;
- b. followed by the reaction of the product of step a with a member of the group consisting of acid- and anhydride-functional materials;

wherein the resultant composition has an acid value less than about 15.

2. The coating composition of Claim 1 wherein the alcohol is selected from the group consisting of mono-functional alcohols, diols and triols having number average molecular weights or below about 4000.

3. The coating composition of Claim 2 wherein the alcohol is selected from the group consisting of:

- a) the C1-C22 linear and branched saturated and unsaturated alcohols including methanol, ethanol, propanol, butanol, hexanol, linoleyl alcohol, trimethylolpropane diallyl ether, allyl alcohol, 2-mercapto ethanol and mixtures thereof,
- b) saturated and unsaturated polyols including glycerol, castor oil, ethylene glycol, dipropylene glycol, 2,2,4-trimethyl 1,3-pentanediol, neopentyl glycol, 1,2-propanediol, 1,3-propanediol, 1,4-butanediol, 1,3-butanediol, 2,3-butanediol, 1,5-pentanediol,

2087914

1,6-hexanediol, 2,2-dimethyl-1,3-propanediol,
1,4-cyclohexanedimethanol, 1,2-cyclohexanedimethanol,
1,3-cyclohexanedimethanol,
1,4-bis(2-hydroxyethoxy)cyclohexane, trimethylene glycol,
tetramethylene glycol, pentamethylene glycol,
hexamethylene glycol, decamethylene glycol, diethylene
glycol, triethylene glycol, tetraethylene glycol,
norbornylene glycol, 1,4-benzenedimethanol,
1,4-benzenedimethanol,
2,4-dimethyl-2-ethylenehexane-1,3-diol,
2-butene-1,4-diol, and polyols such as trimethylolethane,
trimethylolpropane, trimethylolpropane monoallyl ether,
trimethylolhexane, triethylolpropane, 1,2,4-butanetriol,
glycerol, pentaerythritol, dipentaerythritol, and
mixtures thereof;

- c) Polyether polyols prepared by the reaction of a diol or
polyol with an alkylene oxide, including polypropylene
ether glycols and polyethylene ether glycols;
- d) polyesters prepared by the condensation of polyhydric
alcohols and polycarboxylic acids or anhydrides, with or
without the inclusion of drying oil, semi-drying oil, or
non-drying oil fatty acids while maintaining an excess
of hydroxyl groups;
- e) hydroxy-functional polymers prepared by the ring opening
reaction of epoxides and/or polyepoxides with primary or,
preferably, secondary amines or polyamines;

2087914

(f) hydroxy-functional urethane polymers prepared by the reaction of an excess of at least one alcohol with isocyanates.

4. The coating composition of Claim 2 wherein for each mole of polyethylene terephthalate, from about 1.0 to about 1.35 moles of hydroxy functionality and from about 0.50 to about 0.75 moles of acid/anhydride functionality are present.

5. The coating composition of Claim 3 wherein the alcohol is selected from the group consisting of mono-functional alcohols including trimethylolpropane diallyl ether and allyl alcohol, diols and triols including ethylene glycol, dipropylene glycol, 2,2,4-trimethyl 1,3-pentanediol, neopentyl glycol, 1,2-propanediol, 1,3-propanediol, 1,4-butanediol, 1,3-butanediol, 2,3-butanediol, 1,5-pentanediol, 1,6-hexanediol, 2,2-dimethyl-1,3-propanediol, 1,4-cyclohexanedimethanol, 1,2-cyclohexanedimethanol, 1,3-cyclohexanedimethanol, 1,4-bis(2-hydroxyethoxy)cyclohexane, trimethylene glycol, tetramethylene glycol, pentamethylene glycol, hexamethylene glycol, decamethylene glycol, diethylene glycol, triethylene glycol, tetraethylene glycol, norbornylene glycol, 1,4-benzenedimethanol, 1,4-benzenediethanol, 2,4-dimethyl-2-ethylenhexane-1,3-diol, 2-butene-1,4-diol, and polyols such as trimethylolmethane, trimethylolpropane, trimethylolpropane monoallyl ether, trimethylolhexane,

2087914

triethylolpropane, 1,2,4-butanetriol, glycerol, pentaerythritol, dipentaerythritol, and mixtures thereof.

6. The coating composition of Claim 5 wherein the alcohol is selected from the group consisting trimethylolpropane diallyl ether, propylene glycol, ethylene glycol, diethylene glycol, and mixtures thereof.

7. The coating composition of Claim 1 wherein the acid- and anhydride-functional materials are selected from the group consisting of mono-functional acids, including benzoic, crotonic and sorbic acids; acids having an acid functionality on average of at least two, including phthalic acid, succinic acid, adipic acid, azelaic acid, maleic acid, fumaric acid, trimellitic acid, trimesic acid, naphthalene dicarboxylic acids, carboxy-terminated polybutadiene, benzophenone tetracarboxylic dianhydride, 4,4'-dicarboxy diphenoxy ethane, hydroxy carboxylic acids of piralactone; saturated acids, including butyric, caproic, caprylic, capric, lauric, myristic, palmitic, stearic, 12-hydroxystearic, arachidic, behenic and lignoceric acids; unsaturated acids, including palmitoleic, oleic, ricinoleic, linoleic, linolenic, eleostearic, licanic, gadoleic and eracic acids; oils (and their fatty acids) including canola, rapeseed, castor, dehydrated castor, coconut, coffee, corn, cottonseed, fish, lard, linseed, oticloa, palm kernal, peanut, perilla, safflower, soya, sunflower, tallow, tung, walnut, vernonia, tall and menhaden oils; blends and mixtures of natural and

2087914

synthetic oils and fatty acids, particularly oils and fatty acids with high iodine numbers; anhydrides, including, phthalic anhydride, 3-nitrophthalic anhydride, 4-nitrophthalic anhydride, 3-fluorophthalic anhydride, 4-chlorophthalic anhydride, tetrachlorophthalic anhydride, tetra bromophthalic anhydride, tetrahydrophthalic anhydride, hexahydro phthalic anhydride, methylhexahydrophthalic anhydride, succinic anhydride, dodecenylsuccinic anhydride, octylsuccinic anhydride, maleic anhydride, dichloromaleic anhydride, glutaric anhydride, adipic anhydride, chlorendic anhydride, itaconic anhydride, citraconic anhydride, endo-methylenetetrahydrophthalic anhydride, cyclohexane-1,2-dicarboxylic anhydride, 4-cyclohexene-1,2-dicarboxylic anhydride, 4-methyl-4-cyclohexene-1,2-dicarboxylic anhydride, 5-norbornene-2,3-dicarboxylic anhydride, 1,4-cyclohexadiene-1,2-dicarboxylic anhydride, 1,3-cyclopentanedicarboxylic anhydride, diglycolic acid anhydride; anhydrides having a free carboxyl group in addition to the anhydride group, including trimellitic anhydride, aconitic anhydride, 2,6,7-naphthalene tricarboxylic anhydride, 1,2,4-butane tricarboxylic anhydride, 1,3,4-cyclopentane tricarboxylic anhydride; and mixtures thereof.

8. The coating composition of Claim 7 wherein the acid- and anhydride-functional materials are selected from the group

2087914

consisting of the vegetable fatty acids of Claim 7 and trimellitic anhydride.

9. A coating composition comprising:

- 5 a. the reaction product of polyethylene terephthalate with an alcohol in the presence of a catalyst;
- b. wherein the composition of step a is further reacted with a member of the group consisting of acid- and anhydride-functional materials to produce a composition having an acid value less than about 15;
- 10 c. wherein acrylic and other ethylenically unsaturated monomers are subsequently polymerized in the presence of the composition of step c.

10. The coating composition of Claim 9 wherein the alcohol is selected from the group consisting of mono-functional alcohols, diols and triols having number average molecular weights of below about 4000.

15

11. The coating composition of Claim 10 wherein the alcohol is selected from the group consisting of:

- 20 a) the C1-C22 linear and branched saturated and unsaturated alcohols including methanol, ethanol, propanol, butanol, hexanol, linoleyl alcohol, trimethylolpropane diallyl ether, allyl alcohol and mixtures thereof,
- b) saturated and unsaturated polyols including glycerol, castor oil, ethylene glycol, dipropylene glycol,
- 25 2,2,4-trimethyl 1,3-pentanediol, neopentyl glycol,

2087914

1,2-propanediol, 1,3-propanediol, 1,4-butanediol,
1,3-butanediol, 2,3-butanediol, 1,5-pentanediol,
1,6-hexanediol, 2,2-dimethyl-1,3-propanediol,
1,4-cyclohexanedimethanol, 1,2-cyclohexanedimethanol,
1,3-cyclohexanedimethanol,
1,4-bis(2-hydroxyethoxy)cyclohexane, trimethylene glycol,
tetramethylene glycol, pentamethylene glycol,
hexamethylene glycol, decamethylene glycol, diethylene
glycol, triethylene glycol, tetraethylene glycol,
norbornylene glycol, 1,4-benzenedimethanol,
1,4-benzenedimethanol,
2,4-dimethyl-2-ethylenhexane-1,3-diol,
2-butene-1,4-diol, and polyols such as trimethylolethane,
trimethylolpropane, trimethylolpropane monoallyl ether,
trimethylolhexane, triethylolpropane, 1,2,4-butanetriol,
glycerol, pentaerythritol, dipentaerythritol, and
mixtures thereof;

c) Polyether polyols prepared by the reaction of a diol or
polyol with an alkylene oxide, including polypropylene
ether glycols and polyethylene ether glycols;

d) polyesters prepared by the condensation of polyhydric
alcohols and polycarboxylic acids or anhydrides, with or
without the inclusion of drying oil, semi-drying oil, or
non-drying oil fatty acids while maintaining an excess
of hydroxyl groups;

2087914

- e) hydroxy-functional polymers can be prepared by the ring opening reaction of epoxides and/or polyepoxides with primary or, preferably, secondary amines or polyamines;
- f) hydroxy-functional urethane polymers prepared by the reaction of an excess of at least one alcohol with isocyanates.

12. The coating composition of Claim 11 wherein for each mole of polyethylene terephthalate, from about 1.0 to about 1.35 moles of hydroxy functionality and from about 0.50 to about 0.75 moles of acid/anhydride functionality are present.

13. The coating composition of Claim 12 wherein the alcohol is selected from the group consisting of mono-functional alcohols including trimethylolpropane diallyl ether and allyl alcohol; diols and triols including ethylene glycol, dipropylene glycol, 2,2,4-trimethyl 1,3-pentanediol, neopentyl glycol, 1,2-propanediol, 1,3-propanediol, 1,4-butanediol, 1,3-butanediol, 2,3-butanediol, 1,5-pentanediol, 1,6-hexanediol, 2,2-dimethyl-1,3-propanediol, 1,4-cyclohexanedimethanol, 1,2-cyclohexanedimethanol, 1,3-cyclohexanedimethanol, 1,4-bis(2-hydroxyethoxy)cyclohexane, trimethylene glycol, tetramethylene glycol, pentamethylene glycol, hexamethylene glycol, decamethylene glycol, diethylene glycol, triethylene glycol, tetraethylene glycol, norbornylene glycol, 1,4-benzenedimethanol, 1,4-benzenediethanol, 2,4-dimethyl-2-ethylhexane-1,3-diol, 2-butene-1,4-diol, and

2087914

polyols such as trimethylolethane, trimethylolpropane, trimethylolpropane monoallyl ether, trimethylolhexane, triethylolpropane, 1,2,4-butanetriol, glycerol, pentaerythritol, dipentaerythritol; and mixtures thereof.

5 14. The coating composition of Claim 13 wherein the alcohol is selected from the group consisting trimethylolpropane diallyl ether, propylene glycol, ethylene glycol, diethylene glycol, and mixtures thereof.

10 15. The coating composition of Claim 9 wherein the acid- and anhydride-functional materials are selected from the group consisting of mono-functional acids, including benzoic, crotonic and sorbic acids; acids having an acid functionality on average of at least two, including phthalic acid, succinic acid, adipic acid, azelaic acid, maleic acid, fumaric acid, 15 trimellitic acid, trimesic acid, naphthalene dicarboxylic acids, carboxy-terminated polybutadiene, benzophenone tetracarboxylic dianhydride, 4,4'-dicarboxy diphenoxy ethane, hydroxy carboxylic acids of piralactone; saturated acids, including butyric, caproic, caprylic, capric, lauric, 20 myristic, palmitic, stearic, 12-hydroxystearic, arachidic, behenic and lignoceric acids; unsaturated acids, including palmitoleic, oleic, ricinoleic, linoleic, linolenic, eleostearic, licanic, gadoleic and eracic acids; oils (and their fatty acids) including canola, rapeseed, castor, 25 dehydrated castor, coconut, coffee, corn, cottonseed, fish, lard, linseed, oticloa, palm kernal, peanut, perilla,

2087914

safflower, soya, sunflower, tallow, tung, walnut, vernonia, tall and menhaden oils; blends and mixtures of natural and synthetic oils and fatty acids, particularly oils and fatty acids having high iodine numbers; anhydrides, including, phthalic anhydride, 3-nitrophthalic anhydride, 4-nitrophthalic anhydride, 3-fluorophthalic anhydride, 4-chlorophthalic anhydride, tetrachlorophthalic anhydride, tetra bromophthalic anhydride, tetrahydrophthalic anhydride, hexahydro phthalic anhydride, methylhexahydrophthalic anhydride, succinic anhydride, dodecenylsuccinic anhydride, octylsuccinic anhydride, maleic anhydride, dichloromaleic anhydride, glutaric anhydride, adipic anhydride, chlorendic anhydride, itaconic anhydride, citraconic anhydride, endo-methylenetetrahydrophthalic anhydride, cyclohexane-1,2-dicarboxylic anhydride, 4-cyclohexene-1,2-dicarboxylic anhydride, 4-methyl-4-cyclohexene-1,2-dicarboxylic anhydride, 5-norbornene-2,3-dicarboxylic anhydride, 1,4-cyclohexadiene-1,2-dicarboxylic anhydride, 1,3-cyclopentanedicarboxylic anhydride, diglycolic acid anhydride; anhydrides having a free carboxyl group in addition to the anhydride group, including trimellitic anhydride, aconitic anhydride, 2,6,7-naphthalene tricarboxylic anhydride, 1,2,4-butane tricarboxylic anhydride, 1,3,4-cyclopentane tricarboxylic anhydride and mixtures thereof.

16. The coating composition of Claim 15 wherein the acid- and anhydride-functional materials are selected from the group consisting of the vegetable fatty acids of Claim (5) and trimellitic anhydride.

5 17. The coating composition of Claim 9 wherein the acrylic and other ethylenically unsaturated monomers are selected from the group consisting of acrylic esters, including methyl (meth)acrylate, ethyl (meth)acrylate, propyl (meth)acrylate, butyl (meth)acrylate, hydroxy ethyl (meth)acrylate, and 2-ethyl hexyl (meth)acrylate; acrylonitrile; acrylamide; ~~vinyl~~
10 ~~polymers including polymers of~~ vinyl esters of inorganic or organic acids, including vinyl chloride, vinyl acetate, vinyl propionate, vinyl toluene; styrene; acrylic acids, including acrylic acid, methacrylic acid and itaconic acid; and mixtures
15 thereof.
